1.7 Figure 5 (base)

Notes. Left-hand side bars are (unweighted) matched pairs in which the man satisfies Conditions 1 and 2; right-hand-side bars are pairs in which the woman does. Estimated density functions drawn in grey, weighted by frequency observations are used in a match. See Table 9 for conditional means, standard deviations and sample sizes.

3 LLM Evaluation Rubric

Table 1: LLM Evaluation Rubric

#	Criterion	Description	Scale (1–10)
G1 Creativity & Hedging			
1	Modal Verb Strength	Balance of weak (<i>may, might</i>) vs. strong (<i>will, cannot</i>) modals	1=only weak; 10=only strong
2	Hedging Frequency & Type	Frequency of single-word qualifiers and larger stance phrases (<i>it seems that, we believe</i>)	1=continuous hedging; 10=no hedges
3	Qualifier Density	Use of modifiers (<i>to some extent, relatively</i>) that soften claims	1=extensive qualifiers; 10=none
4	Acknowledgement of Limitations	Explicit mention of caveats or boundary conditions (<i>within context, may not generalize</i>)	1=numerous limitations; 10=none or implicit only
5	Caution-Signaling Connectors	Use of <i>however, nevertheless, on the other hand</i> to signal complexity	1=frequent; 5=occasional; 10=none
G2 Assertiveness & Voice			
6	Assertiveness & Voice	Proportion of unequivocal verbs (<i>prove, confirm</i>) vs. tentative verbs (<i>suggest, explore</i>)	1=almost all tentative; 10=almost all assertive
7	Active/Passive Voice Ratio	Ratio of active (<i>we test</i>) to passive (<i>it was tested</i>) constructions	1=90% passive; 5=50/50; 10=90% active
G3 Structural Directness			
8	Sentence Length & Directness	Degree of multi-clausal, convoluted sentences vs. brief, single-clause statements	1=very long; 10=very short
9	Imperative-Form Occurrence	Presence of direct commands (<i>Apply X</i>) vs. none or only embedded suggestions	1=no imperatives; 10=dominant
G4 Authorial Stance & Novelty			
10	Pronoun Commitment	Use of first-person (<i>we, I</i>) vs. impersonal constructions (<i>the authors</i>)	1=fully impersonal; 10=fully first-person
11	Novelty-Claim Strength	Boldness of originality claims (<i>first to, novel framework</i>)	1=no novelty claim; 5=hedged; 10=grandiose
12	Jargon/Technicality Density*	Density of undefined field-specific terms vs. accessible language	1=minimal jargon; 10=dense undefined jargon
13	Emotional Valence	Presence of emotionally charged adjectives (<i>revolutionary, urgent</i>) vs. neutral descriptors	1=none; 10=frequent
G5 Support & Impact			
14	Evidence & Citation Usage	How consistently claims are backed by data, statistics, or literature citations	1=none; 10=every claim backed
15	Practical/Impact Orientation	Emphasis on real-world applications, policy, or practice implications	1=none; 5=may inform practice; 10=will transform practice
Standalone			
16	Readability	Precision and ease with which a reader can understand the author’s intended meaning	1=difficult; 10=very easy

All criteria are scored 1–10 on surface-level linguistic features only; no inference about author intent is made.

* Scale-flipped (11 – raw score) before computing the G4 composite, so that higher values consistently indicate more accessible language.

Table 2: LLM tonal characteristics by gender

	Men	Women	Difference
LLM Readability	6.73 (0.02)	7.39 (0.05)	0.67 * ** (0.05)

Practical/Impact Orientation	2.37 (0.02)	2.61 (0.06)	0.23 * ** (0.06)
No. observations	8.268849		9.117

Notes. Figures are means of LLM-scored tonal characteristics by sex. Male-authored papers are defined as having a ratio of female authors below 50 percent; female-authored papers are those with a ratio of female authors at or above 50 percent. Last column subtracts male means from female means. Standard errors in parentheses. ***, ** and * difference statistically significant at 1%, 5% and 10%, respectively.

4 Table 1 LLM — LLM tonal characteristics by gender

Table 3: Textual characteristics per sentence by gender

	Men	Women	Difference
No. characters	134.72 (0.42)	131.34 (1.30)	−3.37 * *

Notes. Figures represent coefficients on female ratio from 45 separate OLS regressions of readability scores on the ratio of female authors (papers with fewer than 50 percent female authors are classified as male, see the text). (6)–(9) are estimated on the sample of papers published on or after 1990 with a primary *JEL* code; (9) includes 563 articles from *AER P&P* (see the paper). Quality controls denoted by ✓¹ include citation count (asinh), max. T fixed effects (author prominence) and max. t (author seniority). Standard errors clustered on editor in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

6.2 At least one female author

Notes. Figures are means of textual characteristics by sex for NBER working papers and published articles. Male-authored papers are defined as having a ratio of female authors below 50 percent; female-authored papers are those with a ratio of female authors at or above 50 percent. Penultimate columns in each panel subtract working paper figures from published article figures for men (first panel) and women (second panel); difference-in-differences (female less male) shown in the final column. Standard errors in parentheses. ***, ** and * difference statistically significant at 1%, 5% and 10%, respectively.

Notes. Panel one displays coefficients from estimating equation (2) directly via OLS; standard errors clustered by editor in parentheses. Panel two displays coefficients from OLS estimation of equation (3); standard errors clustered by year in parentheses. Panel three displays coefficients from FGLS estimation of equation (6) and equation (7); standard errors clustered by year and robust to cross-model correlation in parentheses. Quality controls denoted by $\checkmark^2$ include citation count (asinh), max. t (author prominence) and max. T (author seniority). The variable "female ratio" defines papers with a strict minority of female authors as male-authored; for papers with 50 percent or more female authors, it is the ratio of female authors on a paper (see the text for more details). ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

10.2 At least one female author

Notes. Coefficients from OLS estimation of equation (16); (2) excludes papers authored only by women who gave birth and/or had a child younger than five at some point during peer review; (6) and (7) exclude papers published before 1990. Year fixed effects refer to the year an article was accepted. The variable "female ratio" defines papers with a strict minority of female authors as male-authored; for papers with 50 percent or more female authors, it is the ratio of female authors on a paper (see the text for more details). Standard errors clustered by submission year in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

14.2 At least one female author

Notes. Coefficients from OLS estimation of equation (16). Third and sixth column estimates pool data from *Econometrica* and *REStud*; the other four columns were separately estimated on data from each journal. The variable "female ratio" defines papers with a strict minority of female authors as male-authored; for papers with 50 percent or more female authors, it is the ratio of female authors on a paper (see the text for more details). Standard errors clustered by submission year in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

Institution effects	✓	✓	✓	✓	✓	✓
Quality controls	✓ ³	✓ ³	✓ ³	✓ ³	✓ ³	✓ ¹
Native speaker	✓	✓	✓	✓	✓	✓

Notes. Estimates are identical to those in Table 76, except that female ratio has been replaced with the interaction between female ratio and a dummy variable equal to 1 if a female author had strictly more top-five papers as her co-authors at the time the paper was published. (Mixed-gendered papers with a senior male co-author are excluded.) ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

17.6 Senior female author

Table 82: D_{ik} (??)

	Higher standards for women ($D_{ik} > 0$)			Higher standards for men ($D_{ik} < 0$)			Mean D_{ik}
	Mean	S.D.	N	Mean	S.D.	N	All obs.
Flesch	9.39	7.80	52	-4.96	5.50	27	2.92 * ** (0.79)
Flesch Kincaid	1.65	1.40	63	-1.30	1.36	23	0.66 * ** (0.16)
Gunning Fog	2.31	1.85	55	-1.55	1.74	24	0.79 * ** (0.20)
SMOG	1.74	1.42	51	-1.00	1.12	27	0.51 * ** (0.15)
Dale-Chall	0.83	0.67	61	-0.67	0.50	25	0.29 * ** (0.08)
LLM Readability	0.77	0.58	72	-0.98	0.54	10	0.36 * ** (0.07)

Notes. Sample 121 matched pairs. First and second panels display conditional means, standard deviations and observation counts of D_{ik} (Corollary 1) from subpopulations of matched pairs in which the woman or man, respectively, satisfies Conditions 1 and 2. Male scores are subtracted from female scores, meaning D_{ik} is, by definition, positive in panel one and negative in panel two. Third panel averages D_{ik} over all matched pairs ($D_{ik} = 0$ whenever neither member simultaneously satisfies Conditions 1 and 2). Estimates are weighted by frequency observations are used in a match; degrees-of-freedom corrected standard errors in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

18 Table 9 — D_{ik}

18.1 Base

18.2 JEL

Table 83: D_{ik} (??), controlling for *JEL* category

	Higher standards for women ($D_{ik} > 0$)			Higher standards for men ($D_{ik} < 0$)			Mean D_{ik}
	Mean	S.D.	N	Mean	S.D.	N	All obs.
Flesch	9.83	8.15	44	−4.65	3.78	10	4.62 * ** (1.60)
Flesch Kincaid	1.94	1.59	46	−1.58	1.08	6	0.99 * ** (0.33)
Gunning Fog	2.56	1.99	39	−1.51	1.02	8	1.13 * ** (0.39)
SMOG	1.83	1.47	37	−0.93	0.72	8	0.76 * ** (0.28)
Dale-Chall	0.85	0.77	30	−0.52	0.60	5	0.28 * * (0.12)
LLM Readability	0.85	0.63	43	−0.42	0.46	18	0.28 * * (0.13)

Notes. Sample 87 matched pairs. Table displays estimates identical to those in Table 82, except that equation (14) accounts for primary *JEL* classification dummies and $\hat{R}_{it}$ was reconstructed at *JEL* category dummies D and J. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

18.3 Robustness (R)

Table 84: D_{ik} (??), without adjusting for the ratio of female authors

	Higher standards for women ($D_{ik} > 0$)			Higher standards for men ($D_{ik} < 0$)			Mean D_{ik}
	Mean	S.D.	N	Mean	S.D.	N	All obs.
Flesch	9.67	7.71	46	-5.80	5.41	26	2.47 * ** (0.75)
Flesch Kincaid	1.68	1.41	51	-1.24	1.35	26	0.50 * ** (0.15)

Predicted $R_{jP} - R_{jW}$					
Women	0.59 * ** (0.14)	0.59 * ** (0.11)	0.59 * ** (0.11)	0.55 * ** (0.13)	0.59 * ** (0.17)
Men	0.50 * ** (0.02)	0.50 * ** (0.01)	0.50 * ** (0.01)	0.46 * ** (0.01)	0.50 * ** (0.02)
Marginal effect of female ratio					
Published article	0.02 (0.13)	0.09 (0.10)	0.16 * * (0.08)	0.23 * ** (0.08)	0.30 * ** (0.11)
Draft paper	-0.07 (0.15)	0.00 (0.13)	0.07 (0.13)	0.14 (0.14)	0.20 (0.18)
Diff.-in-diff.	0.09 (0.15)	0.09 (0.12)	0.09 (0.12)	0.09 (0.14)	0.09 (0.18)

Notes. Sample 4,289 observations. Panel one displays magnitude of predicted $R_{jP} - R_{jW}$ (the direct effect of peer review) for women and men over increasing t . Panel two estimates the marginal effect of an article's female ratio ($\beta_1 + \beta_2 \times t$), separately for draft papers and published articles. Figures from FGLS estimation of equation (15), weighted by N_{it} (see the data appendix). Control variables include citation count (asinh), max. T (author prominence) and max. t (author seniority), native speaker and editor and journal-year fixed effects. Standard errors clustered by editor and robust to cross-model correlation in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

23 Appendix B — Article counts

Table 91: Article count, by journal and decade

Decade	<i>AER</i>	<i>ECA</i>	<i>JPE</i>	<i>QJE</i>	Total
1950–59		120			120
1960–69		343	184		527
1970–79		660	633	1	1294
1980–89	180	648	562	401	1791
1990–99	476	443	478	409	1806
2000–09	693	519	408	413	2033
2010–15	732	382	181	251	1546
Total	2081	3115	2446	1475	9117

Notes. Included is every article published between January 1950 and December 2015 for which an English abstract was found (i) on journal websites or websites of third party digital libraries or (ii) printed in the article itself. Papers published in the May issue of *AER* (*Papers & Proceedings*) are excluded. Final row and column display total article counts by journal and decade, respectively.

Notes. Table lists of each tertiary *JEL* code assigned to the empirical, theory/methodology and other categories.

25 Appendix F — LLM readability

25.1 Table F.1 — Journal readability, comparisons to AER

Table 93: Journal readability, comparisons to *AER*

	Flesch Reading Ease	Flesch- Kincaid	Gunning Fog	SMOG	Dale- Chall
<i>Econometrica</i>	−12.25 * ** (1.92)	−4.42 * ** (0.41)	−4.23 * ** (0.47)	−2.58 * ** (0.38)	−0.67 * ** (0.16)
<i>JPE</i>	−5.54 * ** (1.91)	−3.98 * ** (0.41)	−3.38 * ** (0.47)	−1.80 * ** (0.38)	0.18 (0.16)
<i>QJE</i>	1.51 * * (0.61)	−0.01 (0.13)	0.30 * ** (0.08)	0.21 * ** (0.06)	0.27 * ** (0.05)
No. observations	9.117	9.117	9.117	9.117	9.117

Notes. Figures are the estimated coefficients on the journal dummy variables from column (2) in Table 4. Each contrasts the readability of the journals in the left-hand column with the readability of *AER*. Standard errors clustered on editor in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

25.2 Table F.1 LLM — Journal LLM tonal composites, comparisons to AER

Table 94: Journal LLM tonal composites, comparisons to *AER*

	G1: Creativity & Hedging	G2: Assert. & Voice	G3: Structural Directness	G4: Stance & Novelty	G5: Support & Impact
<i>Econometrica</i>	−0.73 * ** (0.21)	−1.23 * ** (0.32)	−1.87 * ** (0.23)	−0.40* (0.21)	0.07 (0.25)
<i>JPE</i>	−2.50 * ** (0.21)	−0.99 * ** (0.31)	−2.72 * ** (0.23)	0.33 (0.21)	0.79 * ** (0.25)
<i>QJE</i>	−0.48 * ** (0.10)	0.00 (0.13)	−0.08 (0.09)	0.13 * * (0.06)	0.39 * ** (0.11)
No. observations	9.117	9.117	9.117	9.117	9.117

Notes. Figures are the estimated coefficients on the journal dummy variables from column (2) in Table 12. Each column corresponds to a separate OLS regression of LLM tonal composite scores on the ratio of female authors, controlling for editor effects.

Table 95: Gender differences in readability, author-level analysis

	Flesch Reading Ease	Flesch- Kincaid	Gunning Fog	SMOG	Dale- Chall
Female ratio for women (β_1)	2.28 * *	0.25	0.49 * *	0.37 * *	0.20 * *
	(0.90)	(0.20)	(0.24)	(0.17)	(0.09)

Native speaker	✓	✓	✓	✓	✓

Notes. Figures from first-differenced, IV estimation of equation (1) (??) where instruments have been collapsed to create one instrument for each variable and lag distance. Female ratio (women): contemporaneous marginal effect of a paper's female co-author ratio for female authors (β_1); female ratio (men): analogous effect for male authors ($\beta_1 + \beta_2$). (The variable defines papers with a strict minority of female authors as male-authored; for papers with 50 percent or more female authors, it is the ratio of female authors on a paper. See the text for more details.) z -statistics for first- and second-order autocorrelation in the first-differenced errors (?); null hypothesis no autocorrelation. Quality controls denoted by ✓² include citation count (asinh), max. T (author prominence) and max. t (author seniority). Standard errors clustered on author (in parentheses). ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

25.3 Table F.2 — Female ratio

Table 96: Table 95, at least one female author

	Flesch Reading Ease	Flesch- Kincaid	Gunning Fog	SMOG	Dale- Chall
Female ratio for women (β_1)	1.00 (0.67)	0.13 (0.14)	0.22 (0.17)	0.16 (0.12)	0.10* (0.06)
Female ratio for men ($\beta_1 + \beta_2$)	-0.08 (0.56)	-0.00 (0.12)	0.02 (0.14)	0.02 (0.10)	0.04 (0.05)
Female ratio $\times$ male (β_2)	-1.08 (0.80)	-0.13 (0.17)	-0.20 (0.20)	-0.14 (0.15)	-0.06 (0.07)
Lagged score (β_0)	0.04 * * (0.02)	0.05 * * (0.02)	0.03 (0.02)	0.03 (0.02)	0.03 (0.02)
No. observations	9.181	9.181	9.181	9.181	9.181
<i>Tests of instrument validity</i>					
Hansen test (p -value)	0.805	0.964	0.959	0.965	0.830
Sargan test (p -value)	0.369	0.115	0.312	0.161	0.342
<i>z-test for no serial correlation</i>					
Order 1	-18.482	-13.638	-14.896	-17.512	-18.709

Notes. Estimates are identical to those in Table 95, except that female ratio has been replaced with the interaction between female ratio and a dummy variable equal to 1 if a female author had at least as many top-five papers as her co-authors at the time the paper was published. (Mixed-gendered papers without a senior female co-author are included and classified as entirely male-authored.) ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

Notes. Table shows coefficients on female ratio (papers with fewer than 50 percent female authors are classified as male, see the text) and its interaction with an indicator variable equal to one if a journal had in place an official policy of double-blind review at the time a paper was published. Results from estimating equation (3) on the sample of articles published in 1998 or afterwards.

Kowalski, Amanda E.	Schrimpf, Paul	Zhuravskaya, Ekaterina	Groves, Theodore
Kranton, Rachel E.	Kosfeld, Michael		

Notes. Table lists the names of matched pairs from the quantification section. In each panel, female members are listed first; male members second. Matches were generated in Stata using `psmatch2` (?). See the matching estimation section for details on the matching process.

29.3 Table J.3

Table 121: Regression output generating $\hat{R}_{it}$ (??)

	Women		Men	
	$t = 1$	$t = 3$	$t = 1$	$t = 3$
Flesch Reading Ease				
Female ratio	0.29 (3.31)	1.81 (2.70)	-12.65 (9.71)	-2.81 (6.02)
Constant	39.02 * ** (2.47)	41.97 * ** (1.65)	38.19 * ** (1.13)	39.12 * ** (1.18)
Flesch Kincaid				
Female ratio	-0.27 (0.68)	0.36 (0.55)	-0.64 (2.12)	0.88 (1.27)
Constant	-13.63 * ** (0.51)	-13.23 * ** (0.33)	-14.03 * ** (0.25)	-14.01 * ** (0.25)
Gunning Fog				
Female ratio	-0.40 (0.82)	0.66 (0.67)	-3.03 (2.36)	0.83 (1.53)
Constant	-17.10 * ** (0.62)	-16.95 * ** (0.41)	-17.79 * ** (0.27)	-17.56 * ** (0.30)
SMOG				
Female ratio	-0.22 (0.60)	0.43 (0.50)	-2.08 (1.65)	0.36 (1.09)
Constant	-15.04 * ** (0.45)	-14.97 * ** (0.30)	-15.57 * ** (0.19)	-15.32 * ** (0.22)
Dale-Chall				
Female ratio	-0.19 (0.27)	0.20 (0.27)	-3.49 * ** (0.90)	0.14 (0.43)
Constant	-10.88 * ** (0.20)	-10.93 * ** (0.16)	-11.07 * ** (0.10)	-11.14 * ** (0.08)
LLM Readability				
Female ratio	-0.44 (0.35)	0.36 (0.28)	-0.58 (1.02)	0.76 (0.62)
Constant	7.65 * ** (0.26)	7.46 * ** (0.17)	7.16 * ** (0.12)	7.23 * ** (0.12)

Notes. Sample restricted to matched authors. See the matching estimation section for details on how matches were made. Regressions weighted by the frequency observations are used in a match. Standard errors in parentheses. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.

29.4 Table J.3 LLM — Regression output for $\hat{R}_{it}$ (LLM tonal composites)

Table 122: Regression output generating $\hat{R}_{it}$ (LLM tonal composites)

	Women		Men	
	$t = 1$	$t = 3$	$t = 1$	$t = 3$
G1: Creativity & Hedging				
Female ratio	−0.54 (0.34)	−0.26 (0.31)	0.93 (1.09)	2.01 *** (0.72)
Constant	8.33 *** (0.25)	8.31 *** (0.19)	7.76 *** (0.13)	7.70 *** (0.14)
G2: Assertiveness & Voice				
Female ratio	−0.79 *** (0.30)	−0.25 (0.26)	2.02* (1.16)	0.33 (0.53)
Constant	8.91 *** (0.22)	8.61 *** (0.16)	7.93 *** (0.13)	8.45 *** (0.11)
G3: Structural Directness				
Female ratio	−0.28 (0.24)	0.16 (0.20)	0.65 (0.72)	0.88* (0.48)
Constant	3.95 *** (0.18)	3.93 *** (0.12)	3.55 *** (0.08)	3.55 *** (0.10)
G4: Stance & Novelty				
Female ratio	−1.30 *** (0.25)	−0.55 ** (0.23)	0.21 (0.97)	0.62 (0.48)
Constant	4.10 *** (0.18)	3.91 *** (0.14)	3.27 *** (0.11)	3.46 *** (0.10)
G5: Support & Impact				
Female ratio	−0.12 (0.40)	−0.16 (0.36)	1.35 (1.28)	−1.69 ** (0.71)
Constant	2.50 *** (0.30)	2.72 *** (0.22)	2.51 *** (0.15)	2.56 *** (0.14)

Notes. Sample restricted to matched authors. Regressions estimated by OLS using LLM tonal composite scores. Weights are Mahalanobis matching weights. ***, ** and * statistically significant at 1%, 5% and 10%, respectively.
